How do you calculate series voltage & current of a solar panel?

Suppose we have 12V,10A ,120W solar panels connected in series-parallel connection. A set of two solar panels connected in series Series Voltage:  $V_1 + V_2 \dots + V_n$   $12V + 12V = 24V$ . ...(Voltage is additive in series connection) Series Current:  $I_1 = I_2 \dots = I_n$   $10A = 10A = 10Ah$  ...(Current is same in series connection).

What is a parallel connection of PV panels & batteries?

In a parallel connection of PV panels and batteries,the current ratings are added up,while the voltage remains the same. For example,two 12V,5A PV panels in parallel will provide 12V,10A. Similarly,two 12V,100Ah batteries in parallel will provide 12V,200Ah storage capacity. This connection is used when you want to increase the total capacity without increasing the voltage.

How do solar panels & batteries connect in parallel?

In parallel connection,similar terminals of two solar panels or batteries are connected by jumper wires. For example,two 6V (or 12 or 24V) 150W,12.5A solar panels and 12V,100Ah batteries connected in parallel would have the following quantities:  $100Ah + 100Ah = 200Ah$ . The voltage for solar panels and batteries remains the same in parallel connection.

How do 12V solar panels and batteries function?

12V solar panels and batteries function by arranging them in series-parallel combination to increase both the charging power from solar panels and storage capacity of batteries. This way,the more power charges the battery quickly with extra power storage. 12V equals 12V is the initial part of the process.

What is the voltage requirement of a PV module?

Step 1: Note the voltage requirement of the PV array Step 2: Note the parameters of PV module that is to be connected in the series string Open circuit voltage  $V_{OC} = 35\text{ V}$  Voltage at maximum power point  $V_M = 29\text{ V}$  Short circuit current  $I_{SC} = 7.2\text{ A}$  Current at maximum power point  $I_M = 6.4\text{ A}$  Maximum Power  $P_M$
